

Nestled amongst the Saguro Cactus forest, Casa Paciencia responds to its environment through the use of intimate architectural forms, Mexican colors, and earthen hues that echo the hillside and desert setting. This new construction bio-medical think-tank and residential complex is 30,000 square feet and houses 15-20 people at full capacity. Water harvested from the rooftops and patios is reused to provide the landscaping and gardens with water and irrigation.

Casa Paciencia re-imagines the Mexican urban district in an integrated residence and bio-medical think-tank. The distinct village experience is cultivated by intimate and colorful facades, street trees and pedestrian paths. Natural light moves throughout the interior to provide a healthy environment for the exchange of ideas or private thoughts. The interior is also a refuge from the active social community, providing private spaces that foster a one-on-one relationship with the land through multiple views.
